

Motor Efficiency and Carbon Action Plan Global (MECP)

power your power

Energy-Saving, Carbon neutralization, New technology and product

Start with us

Become energy-saving and efficiency increasing

Participants in the action, You can change the world

The aim:

All motors of one user, one region or one city are running, monitoring, accounting and future carbon trading in MECP system

Indispensable high system efficiency

Indispensable high energy savings

Indispensable reduction investment

Increased reliability and service life

Indispensable carbon neutralization

Indispensable social responsibility

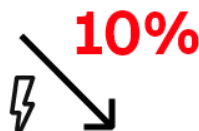

Motor is a key element of global energy conservation and emission reduction actions

Motors consume more than 45% of the world's electricity.

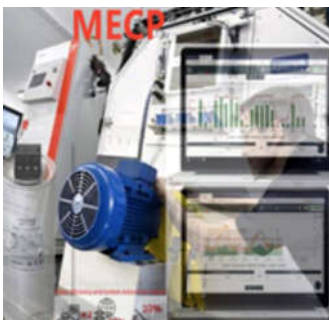

By 2040, the number of motors will double.

Adding energy efficiency devices to motors can reduce global power consumption by up to 10%.

Just add our energy efficiency solutions and devices to the motor to change the world.

Understand energy saving potential

By 2022, the number of all kinds of motors in China will reach 2.95 billion kw, and the annual power consumption accounts for 60% of the total power consumption of the whole society. Most motors, especially power motors, lack local side energy efficiency devices, and the market is very huge!

Motor energy saving, especially on the local side of the motor, is almost blank!

Large and medium-sized enterprises lack understanding and attention to motor energy conservation, especially on the local side of the motor. Every large and medium-sized enterprise can become a continuous service object!

Become our partner

Including global agents, as well as the following types of cooperation:

As an entrepreneurial project,

New business development of the company,

Business transformation of the company,

Business optimization,

Personal new career development, etc.
